

## 1. Understanding the 10 Macro SEO Dimensions

---

The SEO Intelligence Center calculates an Overall Health Score using a weighted multi-dimensional algorithm:

$$\text{Overall Score} = (0.25 \times \text{Tech}) + (0.25 \times \text{Content}) + (0.15 \times \text{Entity}) + (0.15 \times \text{Link}) + (0.10 \times \text{Schema}) + (0.10 \times \text{CTR})$$

- **Technical SEO:** Analyzes header hierarchy, flags broken links, tests image load compression weights, and tracks page metadata integrity.
- **Content Quality:** Inspects copy length, keyword density ratios, reading level statistics, and semantic E-E-A-T trust factors.
- **Entity Coverage:** Indexes key business entities (brand, location, staff) inside pages to align with Google's semantic Knowledge Graph.
- **Internal Linking:** Maps source-target anchor structures to eliminate orphan nodes and evenly route ranking equity.
- **Schema Markup:** Validates structural schema types like Article, FAQ, and Organization to prompt rich Google snippets.
- **CTR Metrics:** Correlates organic impressions with click rates to spotlight low-performing titles.
- **Keyword Score:** Unveils high-opportunity queries ranking on pages 2-3 of search results that are primed for optimization.
- **Indexation Rate:** Monitors the ratio of published pages vs. indexed ones to confirm crawlers can access content.
- **Automation Health:** Keeps historical logs of automated background optimizations, tracking worker success.

## 2. Running and Exporting SEO Reports

---

### Generating Automated Weekly Health Reports

The system integrates a background reporting cron engine (runWeeklyHealthReport) that automatically audits the application and aggregates key performance metrics.

- **Configuration:** Enable the "Weekly SEO Reports" toggle inside Settings to permit automated weekly summaries.
- **Manual Execution:** Go to the Automation Center, check the "Weekly SEO Health Reports" option, and hit "Run Automation" to instantly save a new historical report.

### Exporting Reports as PDF

Every report and dashboard pane supports native browser printing. Press Ctrl + P (Windows) or Cmd + P (Mac) while viewing any dashboard page. The dashboard employs custom CSS print wrappers that format layout tables, scorecards, and charts into a clean, multi-page PDF report automatically.

## 3. Step-by-Step Roadmap to Rank on Page 1

---

Follow this targeted execution strategy to systematically enhance visibility and rank at the top of search listings:

### Step 1: Tackle Quick Wins (First 48 Hours)

Scan the "Quick Win Priority Matrix" on the dashboard. Resolve critical technical errors immediately—such as missing page titles, multiple H1 headings, or broken anchor links. These errors block crawler paths and drag down baseline authority.

### Step 2: Connect Google Search Console & Triage CTR

Navigate to the CTR Optimization tab. Filter search queries with high impressions but low click-through rates. Use the Page SEO Analyzer sidebar to generate click-worthy, AI-optimized page titles and descriptions that stand out on SERPs.

### Step 3: Establish Topical Clusters & Link Hierarchies

Group your posts around central topical pillars. Review the "Internal Links" suggestions in the sidebar and insert contextually relevant links pointing from supporting articles to your main service pages to build a strong topical silhouette.

### Step 4: Deploy Rich Schemas & Entity Mappings

Ensure Organization schema is active on the homepage and FAQ schema is active on sub-pages containing question elements. Register key brand details in the Entity Center. This feeds search bots clean structured data, enabling rich search snippet integrations.
